*Petrovaradin, Karlovacki, Yugoslavia*

---

**Abstract:** *Studies were conducted in Yugoslavia for over 5 years to test the efficacy of a product, which is an extract of bioactive material from medicinal herbs in controlling downy and powdery mildew in vineyards. The level of control achieved with this compound over 5 years was similar to that obtained with chemicals. Yields were also similar with no contaminants in the wine. The potential of using this compound in organic vineyards is presented.*
